

Pipeti and His Lab Friends

Once upon a time, there was a school lab where the equipment came to life when the children left.

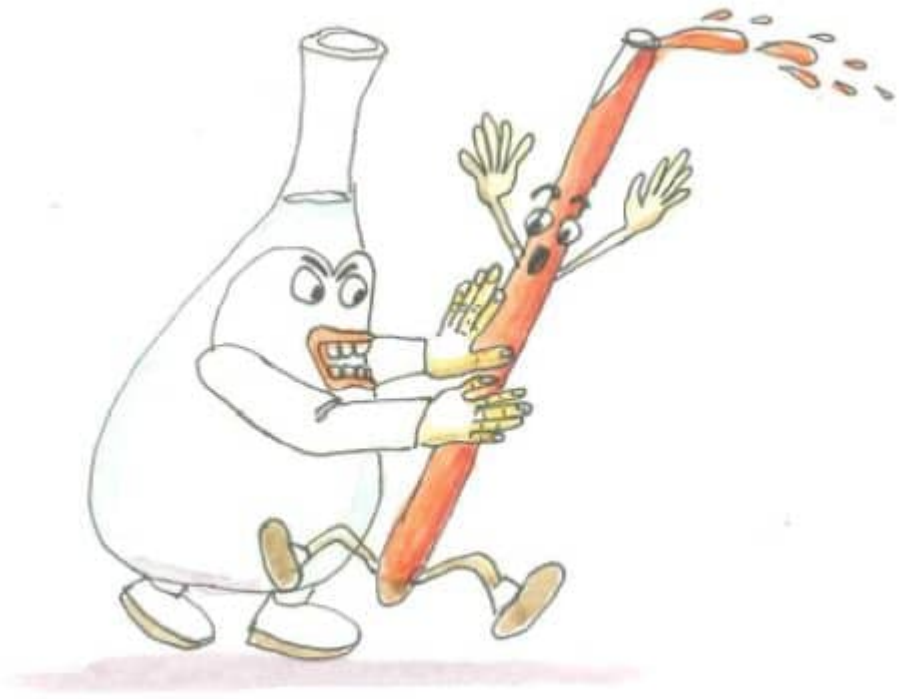

There lived Pipeti, who loved to draw up and release liquids.

There was also Vaseto de Precipitatini, who was the expert at carefully measuring liquids, Matraso, who was the expert at mixing substances, and Gotin, the expert at holding liquids without spilling

them.

Every day they had to do experiments together, but they didn’t always get along well.

Pipeti was the smallest and newest in the lab, sweet and kind, but he often felt less important. Matraso, bigger and more popular, always laughed at him, saying he was too small to be good for anything. Gotin, his best friend, loud and with an ugly smile, also whispered comments that made Pipeti feel insecure. In contrast, Vaseto de Precipitatini was polite, calm, and intelligent.

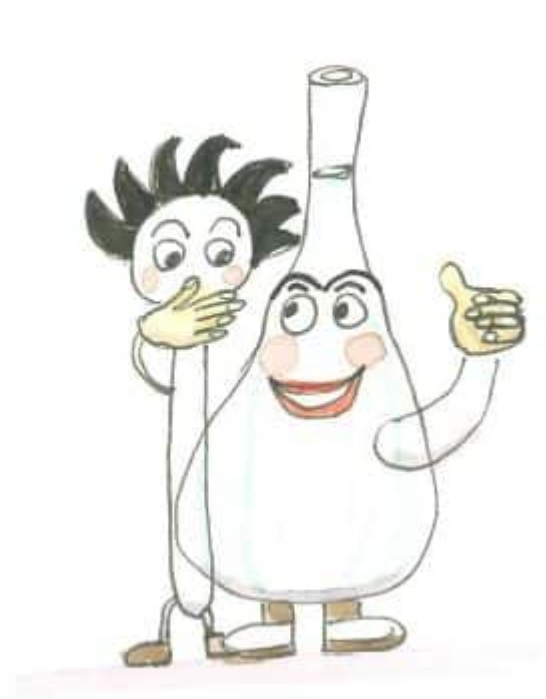

One day, they had to prepare an important experiment on chemical reactions. Pipeti tried to follow the instructions, but Matraso, impatient, pushed him, and he almost fell.

Vaseto de Precipitatini immediately intervened and calmly explained that all the materials were important, large or small, and that each

one had an essential role in the experiment.

Now Pipeti felt more confident, and even Gotin, who had been supporting Matraso, began to listen to them.

As they continued, Pipeti noticed Gotin whispering an idea to Matraso about how to better mix the liquids to avoid spills. That small gesture of trust made Matraso start listening to him and appreciate his help.

Everything seemed to be going better until, due to a lack of coordination, a liquid spilled, and the whole laboratory was left in a mess!

The four friends realized that they couldn’t do their job well without collaboration.

Matraso, embarrassed, apologized to Pipeti, and Gotin also acknowledged that laughing at others wasn’t right.

From that moment on, they decided to help and respect each other.

Pipeti, still small, showed that he could contribute valuable ideas; while Matraso and Gotin learned to listen and cooperate; Vaseto continued to guide and encourage them all.

And that’s how the laboratory materials learned to work together, had excellent experiments, and all lived happily together!
